

# How to run Eclipse from your USB key?

Having a runnable copy of Eclipse on your USB drive is very handy. Here is how to set up Eclipse + JDT on your USB key. It assumes that your USB key is inserted as F:

## Prepare Eclipse

- Download Eclipse Platform and JDT from <http://www.eclipse.org/>
- Extract the content of the two files to the directory "F:\Eclipse"

## Prepare JDK

- You have to have Java Development Kit (JDK) installed on your computer first. Get JDK from <http://java.sun.com>
- Suppose JDK is installed at "C:\jdk", copy the content of the directory "C:\jdk" to the directory "F:\jdk"

## Create a start-up batch file

You could type the following commands every time you want to start Eclipse, or (highly recommended!) save the following commands to the file "F:\eclipse.bat". Then you just need to double-click this file to start Eclipse.

```
@echo off
set JAVA_HOME="jdk"
set ECLIPSE_HOME="Eclipse"
set PATH=%JAVA_HOME%\bin;%PATH%
ECLIPSE_HOME\eclipse.exe
```

## Done
