Optimizing Firefox for broadband

Taken from a PC World article...

Open Firefox

Type **about:config** in address bar and press Enter

Type **network.http** in the filter field

Double-click *network.http.pipelining.maxrequests* to bring up the "Enter integer value' dialog box. Enter a higher number than the default **4**: try **15**. and click OK.

Double-click *network.http.proxy.pipelining* to set it to 'true'.

Right-click anywhere on the page and select *New Integer*. Enter **nglayout.initialpaint.delay** and then click OK.

Set the integer value to **0** (zero) and click OK again.
