

OS X Mountain Lion

- ENVI 5.0 and OS X 10.8 installation
- Install Sophos on Mac OS 10.8

ENVI 5.0 and OS X 10.8 installation

ENVI 5.0 requires additional packages not included in OS X 10.8 Mountain Lion.

Java - ENVI has required Java for years. The ENVI installer will prompt the user and download it as part of ENVI installation.

X11 - X11 is no longer included with Mountain Lion, but the installer will prompt the user to manually download X11 v2.7.2 or later from <http://xquartz.macosforge.org>

Installing X11 using the installer defaults seems to work for most users. v2.7.4 was tested and does seem to work.

Exelis compatibility notes:

<http://www.exelisvis.com/Support/HelpArticleDetail/ArticleId/5294/ENVI-IDL-object-graphics-can-fail-or-crash-ENV-IDL-on-Mac-OS-X-10-8-using-XQuartz-2-7-2.aspx>

Install Sophos on Mac OS 10.8

By default, Mac OS 10.8 only allows users to install applications from 'verified sources'. BOL downloads are not verified; therefore, upon installation you will receive the error message: "Downloaded Program.mpkg" can't be opened because it is from an unidentified developer.

To allow the installation:

Go to System Preferences—> Security & Privacy

Click on the lock icon in the bottom, left corner and enter the Admin password

In the General Tab, under the header "Allow applications downloaded from:", choose Anywhere.
