

Debugging Web Applications with Selenium

Selenium

Selenium is an open-source web application testing system that records and generates testing scripts that can be used for debugging purposes.

Selenium IDE is a Mozilla Firefox plugin that enables users to easily create testing scripts by directly recording user interactions with the web application.

Commands are recorded as they happen, and are listed in the table. You can also go back and edit

commands if you want to change anything later.

Additional commands like `captureEntirePageScreenshot` that can be inserted between commands at critical points where a screenshot would be helpful.

Selenium would be best used for debugging functionality after upgrades and new feature rollouts.

There is a helpful tutorial on [CodeDiesel](#) that shows some of the basics of working with Selenium.
