

# How to provide your own customized WAYF page

It is annoying to have a such long list in InCommon, but your users are limited to just several schools. Here is my solution:

1. Install apache-tomcat server on port 7080, the same machine runs SP but in different port.
2. change wayfURL in SessionInitiator

<http://yourdomain:7080/index.jsp>

The following is a sample index.jsp I am using:

```
<html><%   String timeInMillis = ""+System.currentTimeMillis();%><body><center> <h1>University c
https://wayf.incommonfederation.org/InCommon/WAYF
">                <p>                <input type="hidden" name="shire" value="
https://youdomain/Shibboleth.sso/SAML/POST
" />                <input type="hidden" name="target" value="cookie" />
https://yourdomain/incommon
" />                <input type="hidden" name="time" value="<%=timeInMillis%>" />
```
