

Setting up a personal website at UCLA

There are several services at UCLA that allows students, staff, or faculty to set up personal websites.

Bruin OnLine (BOL) webspace:

Your BOL account (which is the UCLA school-wide username and password that all UCLA people have) comes with 100MB of webspace for you to use. For details, see [this page](#) . The address of your website will be of the format <http://yourUCLAusername.bol.ucla.edu/>. You do not have the ability to run your own server-side scripts on this webspace.

SEASnet (Engineering school computer system) webspace:

If you have a [SEASnet](#) account (all Engineering students, staff, and faculty, and students who are taking engineering classes are eligible for a SEASnet account), then you can set up a webspace on your SEASnet account file space. For instructions, see [this page](#) . The address of your website will be of the format <http://www.seas.ucla.edu/~yourSEASusername/>. I believe that you also do not have the ability to run your own server-side scripts on this webspace.

Other:

Many departments have their own computer account systems that they offer to their members (especially for grad students and faculty). Typically, if these are Unix/Linux clusters, they run a web server that allows you to put a special folder in your home directory (like “www” or “public_html”) that will be accessible from something like <http://whatever.ucla.edu/~yourusername/>. Check with your department for more information. The individual department systems are too numerous to list here.
