

How can I make a screenshot of a web page that scrolls off the screen?

Web Browser Based

- [Super Screenshot](#) — Captures a web page. Choose if it has to grab the full page (including the lower parts) or the top screen only

Firefox Add-ons

- [Fireshot](#) - Windows only, and I'm looking for an OS/X solution. I didn't know Firefox add-ons could be OS specific.
- [Screen Capture Elite - Version 1.0.0.12](#) - the capture full page doesn't seem to work on frames, but if you make the internal frame its own page it captured the full page. Works on OS/X. Has several options including save to clipboard.
- [Screengrab](#) also appears to work on OS/X. It doesn't have Save to clipboard option.

Standalone

- [SnagIt for Windows](#) (\$49) is an all-around solid screen grabbing program
- [Duck Capture](#) For Windows Only (**Free**)
